Deep Space Clustering Network
Subspace Learning:使用无监督方法,从低继起间接与中提取聚类点,
DSC: Non-Linear mapping the data points to a latest space;
A novel self-expressive layer 将数据点表示为其它同一空间点,你发生组和
1. DSC的具体结构
1.1 Self-Expressiveness
X = XC, X = XC, X = [X, X], $C + Self-representation coefficient matrix$
min C p, S.t. X = XC, diag(c)=0 (1)
对于数据不佳的情况,每心义约束条件放宽为正则的加入。即
min $ C _{p}$ $+ \frac{1}{2} x-xC _{F}^{2}$, S.t. $diag(C) = 0$ $ C _{F}$
1.2. Self-Expressive Layer in Veep Auto-Encoders
行号表式: 日: Anto-Enader 芸猷 Ze: Out put of the encoder 日e: Encoder 日d: De weller
Loss function:
$L(\Theta,C) = \frac{1}{2} \ X - \hat{X}_{\theta}\ _{F}^{2} + \lambda \ C\ _{F} + \frac{2}{2} \ Z_{\theta_{e}} - Z_{\theta_{e}}C\ _{F}^{2}$

S.t. diag(C)=0 其中, X。为 decoder 输出的 X C 可初力で原网络.

|| 之日。一之日。C||²中,使用行为山山的线性组合标义,超为公,他好对应了这有激治函数的线性神经元 过有激治函数的线性神经元 因此,将 Self-Expressiveness 项表示为一个线性全连接层,面 (ICII),了视为该层权重的正则化项

行号更新信: Os: self-expressive layer 数,即C

Zee Os: Input to the decoder.

损失函数更新为:

 $\widetilde{L}(\widetilde{\Theta}) = \frac{1}{2} ||X - \widehat{X}_{\widetilde{\Theta}}||_{F}^{2} + \lambda_{1} ||B_{S}||_{F} + \frac{\lambda_{2}}{2} ||E_{\Theta_{E}} - E_{\Theta_{E}} O_{S}||_{F}^{2}$ $5 + \operatorname{diag}(\Theta_{S}) = 0$
